# Introduction to Divided Differences

A new algebraic representation for  $P_n(x)$

# Introduction to Divided Differences

## A new algebraic representation for $P_n(x)$

- Suppose that  $P_n(x)$  is the  $n$ th Lagrange polynomial that agrees with the function  $f$  at the distinct numbers  $x_0, x_1, \dots, x_n$ .

# Introduction to Divided Differences

## A new algebraic representation for $P_n(x)$

- Suppose that  $P_n(x)$  is the  $n$ th Lagrange polynomial that agrees with the function  $f$  at the distinct numbers  $x_0, x_1, \dots, x_n$ .
- Although this polynomial is unique, there are alternate algebraic representations that are useful in certain situations.

# Introduction to Divided Differences

## A new algebraic representation for $P_n(x)$

- Suppose that  $P_n(x)$  is the  $n$ th Lagrange polynomial that agrees with the function  $f$  at the distinct numbers  $x_0, x_1, \dots, x_n$ .
- Although this polynomial is unique, there are alternate algebraic representations that are useful in certain situations.
- The divided differences of  $f$  with respect to  $x_0, x_1, \dots, x_n$  are used to express  $P_n(x)$  in the form

$$P_n(x) = a_0 + a_1(x - x_0) + a_2(x - x_0)(x - x_1) + \cdots + a_n(x - x_0) \cdots (x - x_{n-1})$$

for appropriate constants  $a_0, a_1, \dots, a_n$ .

# Introduction to Divided Differences

$$P_n(x) = a_0 + a_1(x - x_0) + a_2(x - x_0)(x - x_1) + \cdots + a_n(x - x_0) \cdots (x - x_{n-1})$$

- To determine the first of these constants,  $a_0$ , note that if  $P_n(x)$  is written in the form of the above equation, then evaluating  $P_n(x)$  at  $x_0$  leaves only the constant term  $a_0$ ; that is,

$$a_0 = P_n(x_0) = f(x_0)$$

# Introduction to Divided Differences

$$P_n(x) = a_0 + a_1(x - x_0) + a_2(x - x_0)(x - x_1) + \cdots + a_n(x - x_0) \cdots (x - x_{n-1})$$

- To determine the first of these constants,  $a_0$ , note that if  $P_n(x)$  is written in the form of the above equation, then evaluating  $P_n(x)$  at  $x_0$  leaves only the constant term  $a_0$ ; that is,

$$a_0 = P_n(x_0) = f(x_0)$$

- Similarly, when  $P(x)$  is evaluated at  $x_1$ , the only nonzero terms in the evaluation of  $P_n(x_1)$  are the constant and linear terms,

$$f(x_0) + a_1(x_1 - x_0) = P_n(x_1) = f(x_1)$$

# Introduction to Divided Differences

$$P_n(x) = a_0 + a_1(x - x_0) + a_2(x - x_0)(x - x_1) + \cdots + a_n(x - x_0) \cdots (x - x_{n-1})$$

- To determine the first of these constants,  $a_0$ , note that if  $P_n(x)$  is written in the form of the above equation, then evaluating  $P_n(x)$  at  $x_0$  leaves only the constant term  $a_0$ ; that is,

$$a_0 = P_n(x_0) = f(x_0)$$

- Similarly, when  $P(x)$  is evaluated at  $x_1$ , the only nonzero terms in the evaluation of  $P_n(x_1)$  are the constant and linear terms,

$$f(x_0) + a_1(x_1 - x_0) = P_n(x_1) = f(x_1)$$

$$\Rightarrow a_1 = \frac{f(x_1) - f(x_0)}{x_1 - x_0}$$

# Outline

- 1 Introduction to Divided Differences
- 2 The Divided Difference Notation**
- 3 Newton's Divided Difference Interpolating Polynomial

# The Divided Difference Notation

- We now introduce the divided-difference notation, which is related to Aitken's  $\Delta^2$  notation [▶  \$\Delta\$  Definition](#)

# The Divided Difference Notation

- We now introduce the divided-difference notation, which is related to Aitken's  $\Delta^2$  notation [▶  \$\Delta\$  Definition](#)
- The **zeroth divided difference** of the function  $f$  with respect to  $x_j$ , denoted  $f[x_j]$ , is simply the value of  $f$  at  $x_j$ :

$$f[x_j] = f(x_j)$$

# The Divided Difference Notation

- We now introduce the divided-difference notation, which is related to Aitken's  $\Delta^2$  notation [▶  \$\Delta\$  Definition](#)
- The **zeroth divided difference** of the function  $f$  with respect to  $x_i$ , denoted  $f[x_i]$ , is simply the value of  $f$  at  $x_i$ :

$$f[x_i] = f(x_i)$$

- The remaining divided differences are defined recursively.

# The Divided Difference Notation

- The **first divided difference** of  $f$  with respect to  $x_i$  and  $x_{i+1}$  is denoted  $f[x_i, x_{i+1}]$  and defined as

$$f[x_i, x_{i+1}] = \frac{f[x_{i+1}] - f[x_i]}{x_{i+1} - x_i}$$

# The Divided Difference Notation

- The **first divided difference** of  $f$  with respect to  $x_i$  and  $x_{i+1}$  is denoted  $f[x_i, x_{i+1}]$  and defined as

$$f[x_i, x_{i+1}] = \frac{f[x_{i+1}] - f[x_i]}{x_{i+1} - x_i}$$

- The **second divided difference**,  $f[x_i, x_{i+1}, x_{i+2}]$ , is defined as

$$f[x_i, x_{i+1}, x_{i+2}] = \frac{f[x_{i+1}, x_{i+2}] - f[x_i, x_{i+1}]}{x_{i+2} - x_i}$$

# The Divided Difference Notation

- Similarly, after the  $(k - 1)$ st divided differences,

$$f[x_i, x_{i+1}, x_{i+2}, \dots, x_{i+k-1}] \quad \text{and} \quad f[x_{i+1}, x_{i+2}, \dots, x_{i+k-1}, x_{i+k}]$$

have been determined,

# The Divided Difference Notation

- Similarly, after the  $(k - 1)$ st divided differences,

$$f[x_i, x_{i+1}, x_{i+2}, \dots, x_{i+k-1}] \quad \text{and} \quad f[x_{i+1}, x_{i+2}, \dots, x_{i+k-1}, x_{i+k}]$$

have been determined, the  **$k$ th divided difference** relative to  $x_i, x_{i+1}, x_{i+2}, \dots, x_{i+k}$  is

$$\begin{aligned} & f[x_i, x_{i+1}, \dots, x_{i+k-1}, x_{i+k}] \\ &= \frac{f[x_{i+1}, x_{i+2}, \dots, x_{i+k}] - f[x_i, x_{i+1}, \dots, x_{i+k-1}]}{x_{i+k} - x_i} \end{aligned}$$

# The Divided Difference Notation

- Similarly, after the  $(k - 1)$ st divided differences,

$$f[x_i, x_{i+1}, x_{i+2}, \dots, x_{i+k-1}] \quad \text{and} \quad f[x_{i+1}, x_{i+2}, \dots, x_{i+k-1}, x_{i+k}]$$

have been determined, the  **$k$ th divided difference** relative to  $x_i, x_{i+1}, x_{i+2}, \dots, x_{i+k}$  is

$$\begin{aligned} & f[x_i, x_{i+1}, \dots, x_{i+k-1}, x_{i+k}] \\ &= \frac{f[x_{i+1}, x_{i+2}, \dots, x_{i+k}] - f[x_i, x_{i+1}, \dots, x_{i+k-1}]}{x_{i+k} - x_i} \end{aligned}$$

- The process ends with the single  **$n$ th divided difference**,

$$f[x_0, x_1, \dots, x_n] = \frac{f[x_1, x_2, \dots, x_n] - f[x_0, x_1, \dots, x_{n-1}]}{x_n - x_0}$$

# Generating the Divided Difference Table

$x$	$f(x)$	First divided differences	Second divided differences	Third divided differences
$x_0$	$f[x_0]$			
		$f[x_0, x_1] = \frac{f[x_1] - f[x_0]}{x_1 - x_0}$		
$x_1$	$f[x_1]$		$f[x_0, x_1, x_2] = \frac{f[x_1, x_2] - f[x_0, x_1]}{x_2 - x_0}$	
		$f[x_1, x_2] = \frac{f[x_2] - f[x_1]}{x_2 - x_1}$		$f[x_0, x_1, x_2, x_3] = \frac{f[x_1, x_2, x_3] - f[x_0, x_1, x_2]}{x_3 - x_0}$
$x_2$	$f[x_2]$		$f[x_1, x_2, x_3] = \frac{f[x_2, x_3] - f[x_1, x_2]}{x_3 - x_1}$	
		$f[x_2, x_3] = \frac{f[x_3] - f[x_2]}{x_3 - x_2}$		$f[x_1, x_2, x_3, x_4] = \frac{f[x_2, x_3, x_4] - f[x_1, x_2, x_3]}{x_4 - x_1}$
$x_3$	$f[x_3]$		$f[x_2, x_3, x_4] = \frac{f[x_3, x_4] - f[x_2, x_3]}{x_4 - x_2}$	
		$f[x_3, x_4] = \frac{f[x_4] - f[x_3]}{x_4 - x_3}$		$f[x_2, x_3, x_4, x_5] = \frac{f[x_3, x_4, x_5] - f[x_2, x_3, x_4]}{x_5 - x_2}$
$x_4$	$f[x_4]$		$f[x_3, x_4, x_5] = \frac{f[x_4, x_5] - f[x_3, x_4]}{x_5 - x_3}$	
		$f[x_4, x_5] = \frac{f[x_5] - f[x_4]}{x_5 - x_4}$		
$x_5$	$f[x_5]$			

# Outline

- 1 Introduction to Divided Differences
- 2 The Divided Difference Notation
- 3 Newton's Divided Difference Interpolating Polynomial**

# Newton's Divided Difference Interpolating Polynomial

$$P_n(x) = a_0 + a_1(x - x_0) + a_2(x - x_0)(x - x_1) + \cdots + a_n(x - x_0) \cdots (x - x_{n-1})$$

## Using the Divided Difference Notation

# Newton's Divided Difference Interpolating Polynomial

$$P_n(x) = a_0 + a_1(x - x_0) + a_2(x - x_0)(x - x_1) + \cdots + a_n(x - x_0) \cdots (x - x_{n-1})$$

## Using the Divided Difference Notation

- Returning to the interpolating polynomial, we can now use the divided difference notation to write:

$$a_0 = f(x_0) = f[x_0]$$

# Newton's Divided Difference Interpolating Polynomial

$$P_n(x) = a_0 + a_1(x - x_0) + a_2(x - x_0)(x - x_1) + \cdots + a_n(x - x_0) \cdots (x - x_{n-1})$$

## Using the Divided Difference Notation

- Returning to the interpolating polynomial, we can now use the divided difference notation to write:

$$\begin{aligned} a_0 &= f(x_0) &= f[x_0] \\ a_1 &= \frac{f(x_1) - f(x_0)}{x_1 - x_0} &= f[x_0, x_1] \end{aligned}$$

# Newton's Divided Difference Interpolating Polynomial

$$P_n(x) = a_0 + a_1(x - x_0) + a_2(x - x_0)(x - x_1) + \cdots + a_n(x - x_0) \cdots (x - x_{n-1})$$

## Using the Divided Difference Notation

- Returning to the interpolating polynomial, we can now use the divided difference notation to write:

$$\begin{aligned} a_0 &= f(x_0) &= f[x_0] \\ a_1 &= \frac{f(x_1) - f(x_0)}{x_1 - x_0} &= f[x_0, x_1] \end{aligned}$$

- Hence, the interpolating polynomial is

$$\begin{aligned} P_n(x) &= f[x_0] + f[x_0, x_1](x - x_0) + a_2(x - x_0)(x - x_1) \\ &\quad + \cdots + a_n(x - x_0)(x - x_1) \cdots (x - x_{n-1}) \end{aligned}$$

# Newton's Divided Difference Interpolating Polynomial

$$P_n(x) = f[x_0] + f[x_0, x_1](x - x_0) + a_2(x - x_0)(x - x_1) \\ + \cdots + a_n(x - x_0)(x - x_1) \cdots (x - x_{n-1}).$$

- As might be expected from the evaluation of  $a_0$  and  $a_1$ , the required constants are

$$a_k = f[x_0, x_1, x_2, \dots, x_k],$$

for each  $k = 0, 1, \dots, n$ .

# Newton's Divided Difference Interpolating Polynomial

$$P_n(x) = f[x_0] + f[x_0, x_1](x - x_0) + a_2(x - x_0)(x - x_1) + \cdots + a_n(x - x_0)(x - x_1) \cdots (x - x_{n-1}).$$

- As might be expected from the evaluation of  $a_0$  and  $a_1$ , the required constants are

$$a_k = f[x_0, x_1, x_2, \dots, x_k],$$

for each  $k = 0, 1, \dots, n$ .

- So  $P_n(x)$  can be rewritten in a form called Newton's Divided-Difference:

$$P_n(x) = f[x_0] + \sum_{k=1}^n f[x_0, x_1, \dots, x_k](x - x_0) \cdots (x - x_{k-1})$$

## Forward Difference Operator $\Delta$

For a given sequence  $\{p_n\}_{n=0}^{\infty}$ , the **forward difference**  $\Delta p_n$  (read “delta  $p_n$ ”) is defined by

$$\Delta p_n = p_{n+1} - p_n, \quad \text{for } n \geq 0.$$

Higher powers of the operator  $\Delta$  are defined recursively by

$$\Delta^k p_n = \Delta(\Delta^{k-1} p_n), \quad \text{for } k \geq 2.$$
